

More than skin deep

It's what's under the skin that counts

Much like the bone and muscle of the human body the design and construction of the Hyundai Translead refrigerated trailer offers superior strength and thermal efficiency needed in today's environment.

Composite stringers instead of wood offer lighter weight and no de-lamination of the sidewalls interior and floor structure while offering maximum strength to the trailer.

State of the art computerized fusion welding provides superior floor strength and water tight construction thru a controlled manufacturing process.

The patented floor cradle and unique roof design offers increased strength, superior foam adhesion, and greater thermal efficiency for today's extreme operating conditions

Helping in the fight against corrosion associated with today's road chemicals Hyundai's standard equipment includes hot dipped galvanizing of support wing plates, landing gear bracing as well as mud flap and license plate brackets.

These and many more items built in the refrigerated trailer line from Hyundai Translead, like the well built body, will last for years to come.
